SUMMARY

Cyber security major graduating in December 2026, with the Google Technical Support Fundamentals certificate. I build web backends, set up Windows domain labs and write security checks, and I test what I build. Part-time work alongside full-time study since 2024.

EDUCATION

University of Wollongong Feb 2024 to Dec 2026

Bachelor of Computer Science, cyber security major. Subjects include Ethical Hacking, Network Security, System Security, Database Systems, and Algorithms and Data Structures.

Google Technical Support Fundamentals (Coursera) Oct 2026

Google course covering computer hardware, operating systems, networking and software. Verify at coursera.org/verify/IBY0ERDN2PDL

Introduction to Cybersecurity (Cisco Networking Academy) Nov 2026

Student-level course covering common cyber threats, attacks and vulnerabilities, and how organisations defend against them. Verify at credly.com/badges/16da2c8b-625a-4cfe-b809-20136de75b94

SKILLS

Operating systems	Windows Server 2022, Windows 11, Linux
Systems and networking	Active Directory (AD DS and AD CS), Group Policy, SMB shares, VirtualBox, traffic analysis with Scapy and Wireshark
Languages	Python, JavaScript, Java, C++
Backend and data	Node.js, Express, React, Spring Boot, Apache Kafka, REST APIs with JWT, MongoDB, SQLite, Apache Spark, TensorFlow, Keras
Testing and delivery	JUnit, Postman, Cypress, Git, GitHub Actions, Docker
Cyber security	Secure file upload checks, Kali Linux, web app threat modelling, request limits
Workplace	Customer service, POS and cash handling, stock checks, team projects with Git

WORK AND RELEVANT EXPERIENCE

Student developer, industry capstone Mar 2026 to present

Micromax Technology (sponsor company). Backend and admin side of an OKR tracking module, built in a student team (CSIT321). Not paid employment. Node.js, Express, MongoDB, React, Socket.IO, Cypress.

- Blocked unsafe uploads to the sponsor's dashboard, shown by backend integration tests and Cypress end-to-end tests that cover it, by building a scanner that checks file signatures and inspects PDFs, ZIP archives, images and documents.
- Let managers review every blocked upload as it happens, by building an audit page for blocked files and real-time alerts with Socket.IO.
- Delivered my part of the backend and admin side in the shared team repository, shown by 30+ commits of my own, by adding upload rate limiting and role-based permissions.

Team member (part-time) Nov 2024 to present

Coles Group

- Kept the shop floor ready for customers every shift, by helping customers find what they need, collecting trolleys and keeping work areas clean and safe.

Team member (part-time) Jun 2024 to Jun 2025

United Petroleum, Windang NSW

- Served customers at the counter, by processing cash, card and refund transactions on the POS.
- Kept shelves stocked, by restocking, checking stock levels and baking pies to food handling rules.

PROJECTS

Site assistant: a chatbot that sticks to the facts
2026

Independent project. Node.js, JavaScript, Vercel serverless functions. github.com/hamimabbu/site-assistant

- Made the chat on my portfolio answer only from written facts, shown by a script of 100 attack inputs that finds no leaks, by filtering every question, checking every answer against the facts before it is shown and rate limiting each visitor.
- Made it reusable on other sites, shown by its own public repository, by making the AI model optional and testing it with a pretend AI service.

LayerLens: what a browser and connection reveal
Nov 2026

Independent project, not deployed. Node.js, JavaScript, Docker, GitHub Actions. github.com/hamimabbu/layerlens

- Showed visitors what their browser and connection reveal and where each detail came from, as measured by 62 automated tests passing on Node.js 22 and 24 in GitHub Actions, by labelling the source of every result and running lookups only after the visitor agrees.
- Made the risks reviewable, shown by a written threat model with nine risks and the control for each, by writing it alongside the code.

Active Directory home lab
Jul 2026 to present

Windows Server 2022, Windows 11, VirtualBox. github.com/hamimabbu/active-directory-home-lab

- Built a working Windows domain (marvel.local) while following a guided course, and documented it on GitHub, by setting up a domain controller and a Windows 11 client with Certificate Services, Group Policy, an SMB share and a service account. The attacks come next, so there are no attack results yet.

ARP cache poisoning detector
Oct 2025

Six-person assignment (CSCI262). Python, Scapy, Wireshark. github.com/hamimabbu/arp-poisoning-detector

- Detected ARP cache poisoning in my cleaned-up copy of the group tool, shown by 14 unit tests passing on Windows and Linux in GitHub Actions and a demo capture that raises 3 alerts, by using Scapy to flag one MAC address claiming several IPs, or one IP claimed by several MACs, from live traffic or a saved capture file.

TalentMatch Pro recruitment platform
Mar 2026 to Jun 2026

Team project (CSIT314), code not public. Node.js, Express, SQLite, JWT.

- Helped deliver a recruitment platform with JWT login and role-based access, shown by 86 end-to-end tests and 14 backend unit tests passing, by working across the full stack and building an 18-screen interactive prototype.

Online retail system
Jul 2026 to present

Team of three (CSCI318), in progress. Java 21, Spring Boot, Apache Kafka.

- Owned two of the four microservices, by building the Product and Inventory services, the stock change events published on Kafka and the low-stock alerts, and sharing the testing with Postman and JUnit.

Loan default prediction
Mar 2026 to Jun 2026

Team project (CSCI316). Apache Spark MLlib, TensorFlow, Keras.

- Predicted loan defaults on the LendingClub dataset with a team, by contributing to the model work and taking the results through to a 19-slide presentation.

Case studies and code for these projects are on my portfolio and GitHub. To reach me, use LinkedIn.
