Portfolio: hasibur-rahaman-hamim.vercel.app

SUMMARY

Computer Science student with a cyber security major. I build web backends, set up Windows domain labs and write security checks, and I test what I build. Part-time work alongside full-time study since 2024.

EXPERIENCE

Industry capstone for Micromax Technology Mar 2026 to present

Backend and admin side of an OKR tracking module, built in a student team for a sponsor company (CSIT321). Not paid employment. Node.js, Express, MongoDB, React, Socket.IO, Cypress.

- Stopped unsafe files being accepted into the sponsor's dashboard, measured by backend integration tests and Cypress end-to-end tests that cover it, by building a scanner that checks file signatures and inspects PDFs, ZIP archives, images and documents.
- Let managers see and review every blocked upload, shown by 30+ commits of my own in the team repository, by building upload rate limiting, an audit page for blocked files, real-time alerts and role-based permissions.

Coles Group, team member (part-time) Nov 2024 to present

United Petroleum, team member (part-time) Jun 2024 to Jun 2025

PROJECTS

Site assistant: a chatbot that sticks to the facts 2026

Independent project, the chat on my portfolio site. Node.js, JavaScript, serverless functions on Vercel. Repository (https://github.com/hamimabbu/site-assistant)

- Built a chat assistant that answers questions about me from written facts, with a script of 100 attack inputs finding no leaks, by filtering every question, checking every answer against the facts before it is shown and rate limiting each visitor.
- Kept it working without an AI model and published it as its own repository, so it can be reused on another site, by making the AI step optional and testing it with a pretend AI service.

LayerLens: what a browser and connection reveal Nov 2026

Independent project. Node.js, JavaScript, Docker, GitHub Actions. Repository (https://github.com/hamimabbu/layerlens)

- Built a web app that shows visitors what their browser and connection reveal, with 62 automated tests passing on Node.js 22 and 24 in GitHub Actions, by checking the source and limits of every result and running lookups only after the visitor agrees.
- Wrote a threat model that lists nine risks and the control for each.

Active Directory home lab Jul 2026 to present

Windows Server 2022, Windows 11, VirtualBox. Repository (https://github.com/hamimabbu/active-directory-home-lab)

- Built and documented a working domain (marvel.local) on GitHub, by setting up a domain controller and a Windows 11 client with Certificate Services, Group Policy, an SMB share and a service account. The attack exercises come next.

EDUCATION

University of Wollongong Feb 2024 to Dec 2026

Bachelor of Computer Science, cyber security major

Google Technical Support Fundamentals (Coursera) Oct 2026

Verify the certificate on Coursera (https://coursera.org/verify/IBY0ERDN2PDL)

SKILLS

Software

Python, C++, JavaScript, Java, Node.js with Express and React, Spring Boot and Apache Kafka, REST APIs with JWT, JUnit, Postman and Cypress, MongoDB and SQLite, Git, GitHub Actions, Docker

IT and systems

Windows Server 2022 and Windows 11, Active Directory (AD DS and AD CS), Group Policy, SMB shares, VirtualBox, Linux

Cyber security

Secure file upload checks, traffic analysis with Scapy and Wireshark, Kali Linux, web app threat modelling, request limits

More projects, including team projects from my degree, are on my portfolio. To reach me, use LinkedIn.
